

AI Prediction Incident Response

Playbook for responding to automated alerts generated by the LSTM Predictive Model.

Condition: High Failure Probability (> 85%)

When the ML model predicts an >85% chance of failure within the next 60 minutes:

- **Acknowledge:** Open the dashboard and acknowledge the incident.
- **Verify:** Ask the AI Maintenance Copilot to retrieve the current telemetry trend driving the prediction.
- **Intervene:** If the prediction aligns with a known physical degradation signature (e.g., compounding vibration and heat), immediately coordinate with operations to safely ramp down the process load.

Condition: Moderate Risk (50% - 85%)

The model detects anomalous patterns but failure is not imminent. Dispatch a technician with an IR camera and handheld vibration pen to conduct a physical inspection within 24 hours. Do not halt production.
