

Motor Lubrication Procedure

Approved Lubricants

Only use Polyurea-based grease (e.g., Mobil Polyrex EM) for electric motor bearings. Do not mix grease types; mixing incompatible thickeners can cause catastrophic bearing failure.

Application Method

- Clean the grease fitting (Zerk) before attaching the grease gun.
- Remove the grease drain plug at the bottom of the bearing housing to allow old grease to exit.
- Slowly pump new grease while the motor is running (if safe to do so) to ensure even distribution.
- Stop pumping when clean grease begins to purge from the drain hole.
- Leave the drain plug out for 30 minutes to allow excess thermal expansion grease to escape before reinstalling.
